Allowable Subject Matter

8. **Claims 5, 6 and 8 are allowed.**

The following is an examiner's statement of reasons for allowance: Owens et al (6,338,140 B1) teach a method executed by a provider of authorizing provision of service to a user where authorization for placing of a call and its execution is being provided to a user by a service provider where in fig.9, item s100 disclose powering a mobile telephone and interacting with it, a user id such as ESN, MIN is being received and in step s120 where a dynamic PIN is being generated and this the characters in a dynamic format that is associated with the user ID since is being generated based on the receiving of the ESN and MIN of the user mobile device and where having a memory; col.7, lines 46-54 where a database mapping the identification to respective keys or random characters); a second step of interacting with said user to receive from said user information responsive to requests placed to said user in the course of said interacting (see fig.9, item s140-s200 where the request for placing a call and authentication of the user's random PIN according to the mapping database instruction such as calling profile numbers (see abstract) of col.7, lines 46-54 is being processed); and a

third step of authorizing said provision of service when said information received in response to said requests corresponds to a subset of entries in said ordered list of characters that is associated with said requests placed to said user, provided that said service is permitted service for a user who provides said ID (see fig.9, item s220 and s240 where access to the service is granted). Also see abstract where dynamic PIN generator create keys randomly in order to avoid cloning phones and stealing telephone identities.

Walker et al (6,325,284 B1) teach transparent collimating layer on said card, magnifying and narrowing field view (see fig.2, 6, 8 and 10 where the card has a LCD that based on the time set magnify a message based on the ambient light and after time is expired it is narrowed to a point that is not being able to be read. However Owens et al and Walker et al taken singly or in combination does not teach or suggest the relationship between these features: a method of authorizing provision of service to a user comprising the step of: receiving a ID from said user; accessing a database to retrieve N ordered lists of characters associated with said ID, where N is an integer; generating a predetermined number of random variables; for each random number created in said step of generating (d) requesting said user to provide a responsive string of characters that is related to said random number, (e) receiving said responsive string of characters from said user, and (f) flagging a number in said N ordered list corresponding to said random number; and authorizing said provision of service when the set of responsive numbers received in response to a challenges matches a corresponding set of flagged number in any of said N ordered lists of

numbers, provided that said service is a permitted service for a user who is associated with the ordered list that matches **as recited in independent claims 5 and 8** and further a step of authorizing a provision of service when said information received in response to said request corresponds to a subset of entries in said ordered list of characters that is associated with said requests placed to said user, provided that said service is permitted service for user who provides said id **as recited in independent claim 5**.

9. **Dependent claim 6** as being dependent upon Independent claim 5 and having additional allowable features therein.
